DESIGN BULLETIN No. 20-02

SUBJECT: Noise Abatement Wall, Parapet, and Concrete Barrier Mounted Sign Supports

The following revisions and additions to the Illinois Tollway Standard Drawings Section F Sign Structures have been implemented facilitating accessibility during installation and maintenance.

Standard Drawing F11 has been revised and updated. In addition, four (4) additional standard drawings have been added to Section F as described below.

Noise Abatement Wall (NAW) Mounted Sign Support: The 2019 Structure Design Manual specifies a minimum NAW offset of 29” from the front face of NAW to the toe of barrier. The specified 29” offset creates insufficient space to install roadway signs between the roadway and NAW. The 2019 Roadway Signing and Pavement Marking Guidelines Section 2.15 has been updated to allow mounting signs to new NAWs provided that the NAW designs account for the signs and mounting heights. The mounting heights shall be a minimum of 14’-6” above the roadway level. Where the mounting is above the NAW height, the sign support bracket shall be mounted on the NAW posts.

Parapet Mounted Sign Support: At various bridge and retaining wall locations there is no space to mount required regulatory and warning signage without the sign overhanging the roadway. The sign mount detail utilized on previous Illinois Tollway projects had the mount attached to the back of the barrier which has been found to be undesirable due to accessibility issues for maintenance. The new design mitigates those accessibility concerns.

Milepost Marker: The existing milepost marker assembly had some premature failures in the welds. Sign Standard F11 has been revised to strengthen the connection of the post to the base utilizing T-fittings in addition to the welded joint.

Median Barrier Mounted Sign Support: There is currently no separate standard for the median barrier mounted signs. In the absence of the standard, Design Section Engineers (DSE) utilized the milepost marker support to install the sign panels which had a larger sign area than its capacity. A new standard has been developed utilizing telespar posts for the sign post for sign areas up to 20 SF.

The affected standards and new standard are per below:

Standard Drawings:
Revised Drawings: F11
New Drawings: F18, F19 and F20

DSEs are hereby directed to incorporate this design bulletin into all contracts currently under design, currently being advertised and all future contracts.
